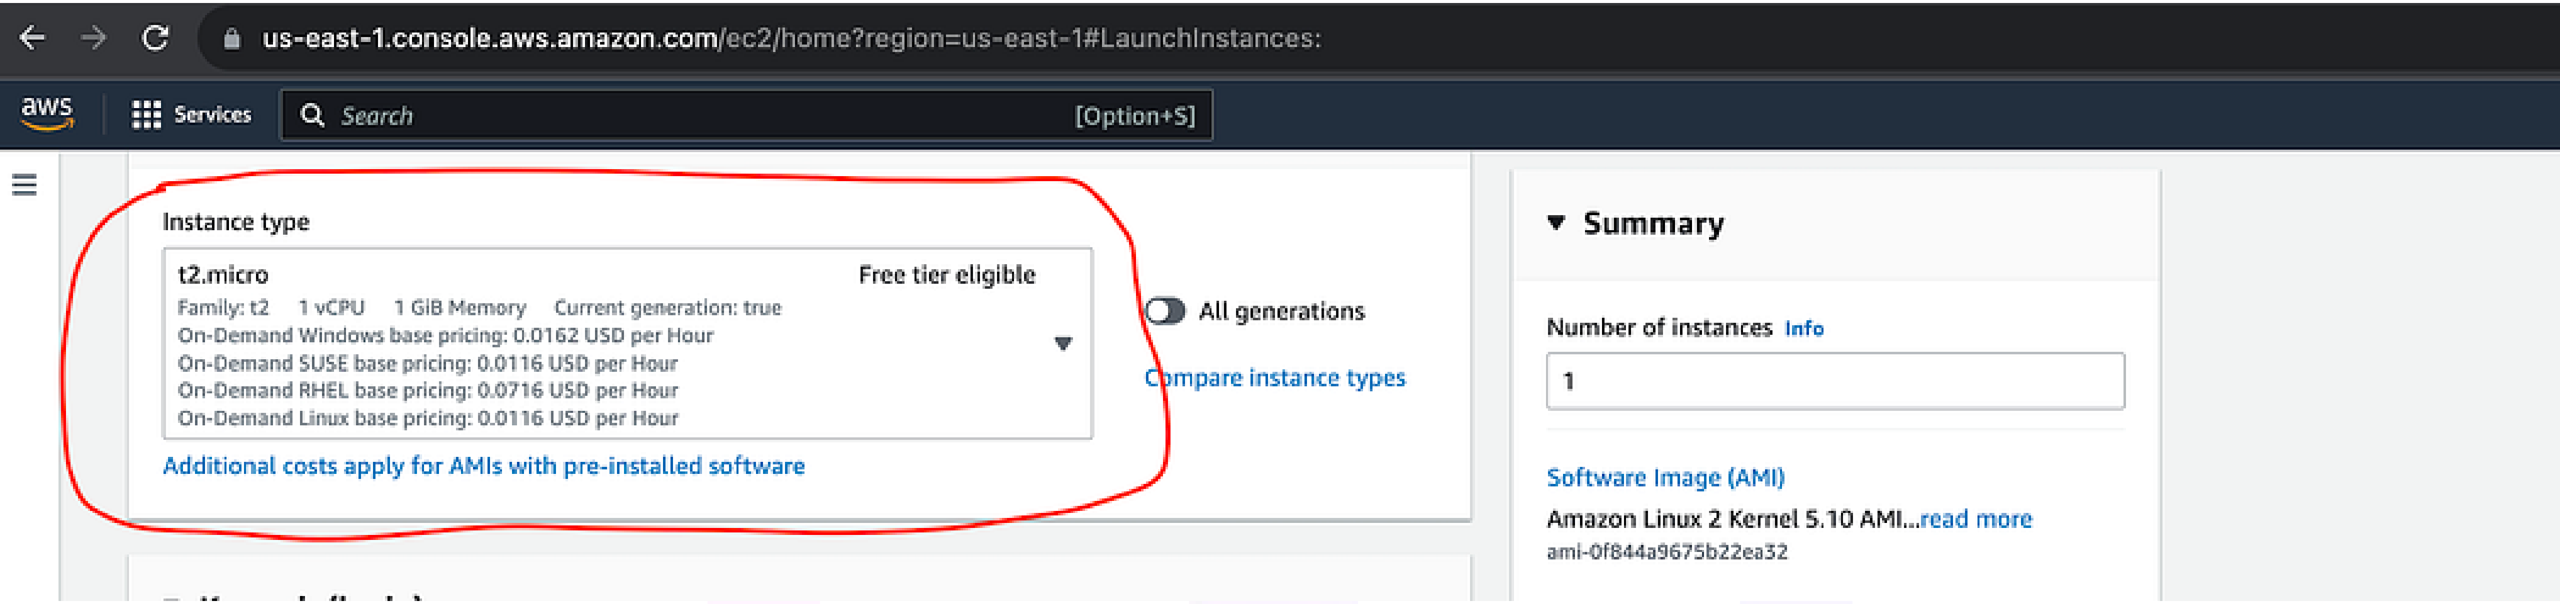
Step 3: Choose Instance Type

- Under **Instance type**, select **t2.micro** or **t3.micro** (depending on your region's AWS Free Tier eligibility).



Step 4: Create Key Pair : Key Pair Configuration: You have two options here:

1). Use an Existing Key Pair: If you've been around the AWS block and have an existing key pair, select "Choose an existing key pair", then pick your key from the dropdown.

2). Create a New Key Pair: If you're new or want a fresh pair of keys, select "Create a new key pair". Name it, download, and store it safely. This is your only shot at downloading it, and you'll need it to SSH into your instance.

- In the **Key pair (login)** block, click **Create new key pair.**
- Give your key pair a name.
- Set the key pair type to RSA.
- Set the private key file format to .ppk.
- Click Create key pair and securely download the file.

Important: Save the .ppk file securely. If someone gains access to it, they may be able to access your EC2 instance. AWS does not allow you to download the private key again, so keep it in a safe location and do not share it with others.
